

# Case Study: Migrating Disparate Electronic Medical Records

**Streamlining the EMR systems of one of the largest vertically integrated independent ophthalmology administrative services organizations on East Coast.**

Our client was growing steadily, completing 2 – 3 acquisitions every quarter. However, it was taking an average of 6 months to merge the acquired entity onto a centralized EMR platform.

The required efforts to maintain the different EMRs for extended periods resulting in loss of time and money and the CTO was under pressure to deliver on time and reduce cost.

**The migrations were managed through a dynamic Extract, Transform, and Load (ETL) process.**

**The team migrated five separate EMRs into the one central EMR system.**

**Migration time was reduced from up to 6 months to around 30 days.**

**The client had a saving of ~\$35K for every month they did not have to support additional platforms.**
